

In the context of Windows, a driver is a computer software component that enables a device (such as a printer or a display device) to interface to a computer or to perform specialized functions. The creator of the driver is often referred to as the driver developer, and the programmer who creates a computer program that requests a driver to work with a device is referred to as a device driver or driver programmer. An operating system manufacturer and the hardware device manufacturer are commonly considered to be the producers of the driver software, and they may decide how to distribute it. On some platform, a driver may need to interact with the operating system kernel, the device driver manager (DDM) or the system service manager (SSM) to create a driver instance or log an error. . 1st Sound blaster live 5.1 digital model sb0220 driver creative emu10k1 jff driver trade name 4000Creative4000.
